

Bandwidth-Adjustable Tunable Filter (Flat-Top)

Bandwidth-Adjustable Filters of WLTF-BA-series are built based on free-space optical Fourier transformation combining with diffraction grating. It is a 2-port fiber-optic device. When a wide-band spectrum is injected to the input port, the tunable filter will select a target band for output and reject the rest band of spectrum. Both bandwidth and center wavelength of the selected target band are tunable independently. Wavelength-tuning is actuated by either a precise micrometer driver or a built-in micro step-motor connected to a PC through a USB interface in which actuation is monitored by a built-in encoder and controlled dynamically in a closed-loop.

Unique optics design provides offers flat-top transmission and unprecedented low insertion loss & polarization dependent loss (PDL). Precise tuning mechanism enables filters to provide high wavelength resolution and excellent wavelength repeatability. Both manual and electric version filters are available over X-, O-, S-, C-, & L- bands.
